

Why Leadman CRM?

Leadman CRM is built with a simple belief: software should do more than just store data. It should help business owners and leaders understand what is happening in their sales process, take better decisions, and act at the right time for growth.

Leadman was shaped through real experience of working with more than 20 businesses and building solutions around their actual day-to-day needs. By learning their pain points, understanding practical sales processes, and following proven sales journey methods like SPANCO, we developed a CRM that is structured, easy to use, and suitable for growing SME businesses.

We also understand that every business does not need a heavy or overly complex system. A practical business needs a solution that fits its size, process, and growth stage. That is why Leadman CRM is designed especially for SMEs — to give the right level of control, visibility, and flexibility without making daily work complicated.

Leadman CRM Features.

A practical CRM should help your team manage inquiries, follow-ups, quotations, orders, customers, and daily coordination in one place. The features below are designed to make sales and office work more organized, trackable, and easier to act on.

Lead Management

Inquiry Management This helps your team capture and manage all business inquiries in one central place. Every inquiry can be tracked from the first contact to the final outcome, so no potential business is missed or forgotten.

Follow-up Tracking The system helps users plan, update, and review follow-ups for each inquiry. This is useful because regular follow-up is often the difference between a lost inquiry and a converted customer.

Follow-up History Every call, update, discussion, or action can be recorded against the inquiry. This gives full visibility to management and team members, especially when multiple people handle the same customer.

Sales Stage Tracking Inquiries can be moved through different stages such as New, Interested, Follow-up, Negotiation, Won, or Lost. This gives a clear picture of where each opportunity stands and what action is needed next.

Stage Colours for Easy View Each stage can be shown in a different colour for faster visual understanding. This makes daily review easier and helps teams quickly identify urgent or pending cases.

Convert Inquiry to Quotation / PI / Order An inquiry can be converted directly into a quotation, proforma invoice, or sales order without re-entering the same details again. This saves time and keeps the full customer journey linked in one place.

Inquiry Source & Reference Tracking The system records where the inquiry came from, such as Facebook Ads, IndiaMART, website form, exhibition, or sales representative. This is useful for measuring lead quality and marketing performance.

Quotation & Proforma Invoice

Quotation and PI Creation Users can create quotations and proforma invoices directly from the system with proper customer details and item information. This helps standardize sales documents and reduces manual work.

Linked with Inquiry for Central Follow-up Quotations and PIs can stay linked with the original inquiry, so the team can continue follow-up from one connected flow. This avoids scattered records and confusion.

Multiple Quotation Versions The system supports revised quotations with proper versioning. This is useful when pricing, terms, or quantities change during negotiation, while still keeping earlier versions for reference.

Quick Copy Quotation A quotation can be copied quickly to prepare a similar one with small changes. This is helpful when dealing with repeated products or similar customer requirements.

Quotation Preview Users can preview the quotation before sharing it. This helps ensure the document looks correct and professional.

Quotation PDF Generation Quotations can be generated in PDF format for easy sharing on WhatsApp, email, or print. This gives a cleaner and more professional presentation to customers.

Branded Proposal Support The system can automatically include company letterhead and also attach custom prefix or suffix PDF pages, such as company profile, product information, terms, or certificates. This helps turn a basic quotation into a stronger business proposal.

Order Management

Sales Order Management Confirmed business can be managed properly through sales orders. This creates a clear next step after quotation approval and helps the team handle execution in an organized way.

Order Follow-up Orders can also be tracked with follow-up notes and status updates. This is useful for managing pending actions, coordination, and customer communication after order confirmation.

Order History All updates related to the order remain recorded in one place. This helps office staff, sales teams, and management stay aligned.

Order Stage Management Orders can move through different stages such as Pending, In Process, Ready, Dispatched, or Completed. This improves internal clarity and customer response quality.

Colour-based Status View Order stages can also be shown in colours for easier daily monitoring and quicker action.

Invoice & Payment Tracking

Invoice Management Invoices can be managed in the CRM so the team has better visibility after order execution. This helps connect sales activity with billing activity.

Pending Payment Tracking The system shows outstanding payments in a clear way, helping teams follow up with customers on time. This is especially useful for businesses where payment collection is an important part of daily operations.

Single Screen Payment Follow-up View Pending payment details can be reviewed from one place, making it easier for owners and staff to see who needs follow-up and where cash is stuck.

Dispatch Management

Basic Dispatch Management Dispatch details can be recorded and tracked in the system. This helps sales, dispatch, and office teams stay updated on whether the material has been sent and what is still pending.

Customer & Contact Management

Central Customer Master All customer details are stored in one central register. This reduces duplicate records and makes customer data easier to maintain.

Customer Dashboard Each customer can have a dedicated dashboard showing their inquiries, quotations, orders, payments, history, and key details in one place. This gives a complete business view without searching across multiple screens.

Multiple Contacts per Customer One customer can have multiple contact persons such as owner, purchase manager, accountant, or site supervisor. This is useful for businesses that deal with different people for different purposes.

Contact Dashboard Each contact person can also have a clear view of related interactions and records. This helps when follow-up depends on a specific individual rather than the company in general.

Customer Lifetime Value Tracking The system helps you understand the total business received from each customer over time. This is useful for identifying valuable customers and planning retention efforts.

Customer History A full history of business interactions remains available for future reference. This helps in better service, smarter follow-up, and long-term relationship building.

Marketing Lead Integrations

Facebook Lead Form Integration Leads generated through Meta lead forms can be pushed directly into the CRM in real time and assigned automatically to the selected person. Past leads can also be fetched in bulk, and multiple lead forms can be connected. This is useful for businesses running digital ad campaigns and wanting faster lead response.

IndiaMART Integration Leads from IndiaMART can be imported directly into the CRM and assigned automatically to users. Buy leads and call-based leads can be handled separately, helping teams respond faster and more systematically.

TradeIndia Integration Leads from TradeIndia can be imported directly into the CRM and assigned automatically. This reduces manual work and avoids missed inquiries.

Exporter India Integration Leads from Exporter India can also be imported into the CRM for faster action and better control over incoming inquiries.

Customer Verification & Trust Support

GST Verification By checking the GST number, the system can help fill company details like name and address and also show important GST-related information. This is especially useful when dealing with a new or unknown buyer, particularly in credit sales, because it helps verify whether the party appears genuine.

Inventory Support

Basic Inventory Management The CRM can support basic stock handling so teams know current stock availability while making commitments to customers. This helps reduce wrong promises and stock-related confusion.

Live Stock View Users can check stock status in real time, which is useful during inquiry handling, quotation making, and dispatch planning.

Manual Stock Adjustment Stock can be adjusted manually where needed to match actual inventory situations.

Multi-Warehouse Support Stock can be managed across multiple warehouses or locations, which is useful for businesses operating from more than one store or stock point.

Auto Stock Deduction on Dispatch Inventory can reduce automatically when dispatch is recorded. This helps keep stock figures more accurate with less manual effort.

Reminders & Tasks

Reminder Management The system supports one-time and recurring reminders for business and personal use. This is useful for things like document renewals, GST dates, payment reminders, service follow-ups, or routine office tasks.

Task Management Users can create, assign, and track tasks inside the CRM. This helps teams coordinate work, especially when activities involve follow-up, office processing, approval, or customer action.

Task Follow-up & History Task progress and updates can be recorded over time, so there is clarity on what was done, what is pending, and who is responsible.

Task Stage Tracking Tasks can be moved through stages with stage-wise colours for a cleaner view and easier monitoring.

Lead Capture & Data Collection

Website Lead Forms Lead capture forms can be placed on your website so inquiries come directly into the CRM. This reduces manual entry and makes website inquiries easier to manage.

Public Lead Entry Forms Lead forms can also be shared through public links for use in exhibitions, events, campaigns, or quick data collection by staff on the field.

Lead Qualification Form A structured lead qualification form can be configured and used by the team while handling inquiries. This helps collect important details in a standard format so teams can judge whether a lead is serious, relevant, and worth priority attention.

Customer Feedback Module After a certain number of days from order completion, the team can follow up with the customer and record structured feedback. The feedback form can be configured centrally, so all responses remain organized and comparable.

Access Control & Team Structure

Custom Role Management Roles can be created according to the organization's working style, and permissions can be assigned in detail. This helps control who can see, edit, approve, or manage different parts of the CRM.

Organization Hierarchy for Reporting The CRM can define reporting hierarchy so managers can see their own data as well as their team's activities. This is useful for businesses with team leaders, branch heads, or sales managers who need controlled visibility.

Lead Team Collaboration A lead can have an assignee as well as additional watchers or team members. This is useful when multiple people need to stay informed, support the process, or pick up the lead based on availability or team structure.

Smart Sales Operations

Smart Auto Lead Assignment Leads can be assigned automatically using round-robin, load balancing, or custom rules based on source, product, city, and other factors. This helps distribute inquiries fairly and quickly without manual dependency.

Sales Pipeline Customization The business can customize sales stages according to its actual sales process. This is helpful because not every business follows the same inquiry journey.

Multiple Sales Pipelines Different types of inquiries can follow different stage flows. For example, one product line may need a short pipeline, while another may need technical discussion, sampling, and approval before closing.

Recurring Business Tracking This helps track customers who usually give repeat business every month or at regular intervals. If a regular customer is running behind their normal business level, the team can follow up on time and avoid missed sales opportunities.

Lead Source ROI Tracking Marketing expenses can be linked with lead sources such as ads, exhibitions, or campaigns, and then compared against actual order conversion and revenue. This helps business owners understand which sources are giving results and where money is being wasted.

Meetings, Visits & Field Work

Meeting Notes Users can record meeting summaries or minutes of meeting for internal discussions, customer meetings, or director-level reviews. This helps preserve important points, decisions, and follow-up actions.

Field Visit Tracker with Location Punch Field staff can record customer visits with location details, visit type, remarks, and customer linking. This helps monitor field activity more practically and provides proof of visit records.

Communication & Email

Email Integration The CRM can connect with organization-level or user-level email accounts and offer basic mailbox functions such as inbox, reply, and forward. Users can also send emails directly from leads, quotations, orders, and other records, helping keep communication closer to business activity.

Template-based Email Sending Frequently used emails can be sent using templates. This saves time and improves consistency in customer communication.

Automated Email Follow-ups The system can send reminder-based or rule-based emails automatically where needed. This is useful for basic follow-up automation.

Dashboards & Reporting

Dynamic Dashboard Users can create their own dashboard by arranging charts, KPIs, and tables based on what they want to monitor regularly. This gives more control to business owners, managers, and staff depending on their roles.

Call History & Power Calling Analysis Call records can be analyzed to understand calling volume, incoming and outgoing calls, missed calls, total duration, and working patterns. This is useful for reviewing telecalling performance and understanding how time is actually being used.

Notes & Internal Knowledge

Advanced Notes Module The CRM can also serve as a place for personal notes, team notes, SOPs, research notes, sticky notes, or knowledge entries. Features like autosave, categories, colour tags, archive, preview, and version history make it useful for day-to-day business knowledge management.

Automation & Integration

Workflow Automation Rule-based actions can be created so the system performs routine steps automatically when certain conditions are met. For example, when a lead reaches a certain stage, the CRM can send a message, assign a user, or trigger the next step. This reduces manual follow-up work and improves consistency.

Webhooks The CRM can share important updates such as new lead creation or status changes with other software. This is useful for quick integrations with websites, apps, or external systems.

Custom APIs Custom APIs can be provided where businesses need deeper integration with third-party software. This is useful when the CRM needs to exchange data with ERP systems, websites, portals, or other internal tools.

Flexible Business Setup

Custom Fields Additional fields can be added to modules like leads, quotations, PIs, or orders as per business need. This is useful when a company wants to capture industry-specific information without changing the main working flow.

Multi-Currency Support The CRM can handle business transactions involving multiple currencies. This is useful for businesses working with export, import, or international customers.

Utility Modules

Visitor Diary / Contact Register This works like a digital reception register or business contact diary. It helps store visitor information, useful contacts, remarks, and tags so the business can refer back to them later whenever needed.

Suitable for Everyday Business Use

Leadman CRM is designed to help SMEs handle their daily sales and customer processes in a more organized way. It brings inquiries, follow-ups, quotations, orders, customers, reminders, teamwork, and reporting into one connected system, so the business can work with better clarity and control.
